

## SOFTWARE FOR ADMINISTRATORS IN A HURRY

**ADMINISTRATION** - Scripts ready for use to automate management of user resource related tasks.

What makes User Management Resource Administrator easy to use is that you don't need to know how to script and handle variables. Script building becomes a simple drag-and-drop action (see illustration above) in clear and functional interface. All scripts are preconfigured and can be used without change in 80% of cases. Better still: for those who have never tried scripting, User Management Resource Administrator functions by default in test mode, preventing errors. User Management Resource Administrator also contains an event log in which all project modifications are recorded. A 30 day evaluation version is available on the editor's web site.

Just like the market, companies have their own cycles: when there is demand, they recruit additional people; when the market is in a recession, they destroy previously created jobs. Problem: this monopolizes enormous amounts of network administrator effort and time in management of user resources to stay up to date. To solve this recurrent and complex problem, software editor Tools4ever has just released User Management Resource Administrator, a visual scripting software solution which is easy to use. Pricing starts at an attractive €277 w/o appropriate taxes. User Management Resource Administrator can be used on all Windows NT or higher networks (Active Directory on Windows 2000 and Windows Server 2003). Usage examples vary from generating strong user passwords to importing user names into the Active Directory from a CSV file, to even automatically create and assign Exchange mailboxes for new user accounts, and much more.
